1 PROBLEM

(Prob, 5.1) It is given that in a group of three students, the probability of 2 students not having the same birthday is 0.992. What is the probability that the two students have the same birthday?

2 SOLUTION

We know that two students either have birthday on same date or they don't have same birthday. No other cases are possible.

Therefore, we can consider this as a bernoulli distribution, by defining a random variable X such that, if $X = 0$, then they don't have same birthday, if $X = 1$, then they have same birthday. Therefore,

$$Pr(X = 0) + Pr(X = 1) = 1 \quad (2.0.1)$$

$$Pr(X = 0) = 0.992 \quad (2.0.2)$$

$$Pr(X = 1) = 1 - Pr(X = 0) \quad (2.0.3)$$

$$Pr(X = 1) = 1 - 0.992 \quad (2.0.4)$$

$$Pr(X = 1) = 0.008 \quad (2.0.5)$$

Therefore, the probability of two people not having same birthday is 0.008.
